Question 1

Topic: Lecture 6

Source: Lecture 6

We took a look at how vectors can be added / subtracted in vector space. Why does this work? (hint: think back to the general properties of word embeddings that we've wanted from the very start) (1)

Question 2

Topic: Lecture 5

Source: Lecture 5

We've seen co-occurrence matrices weighted by TF-IDF- would it make sense to weight them by PMI? Briefly explain. (1)

Question 3

Topic: Lecture 5

Source: Lecture 5

What is PMI measuring? That is, what does it mean for two words to have high PMI? (1)

Question 4

Topic: Lecture 7

Source: Lecture 7

How is the TextTiling algorithm similar to the Lesk algorithm? How is it different? (2)

Question 5

Topic: Lecture 8

Source: Lecture 8

Describe a Discourse Unit. (1)

Question 6

Topic: Lecture 8

Source: Lecture 8

Why is it easy to create negative examples for lexical coherence tests? (1)

Question 7

Topic: Lecture 7

Source: Lecture 7

The TextTiling algorithm we looked at just looked at raw word overlap (possibly with stop-word removal). Describe a way that we could improve the algorithm to maximize coverage.
(2)

Question 8

Topic: Lecture 6

Source: Lecture 6

Think back to week 1 of this block when we were doing word sense disambiguation. Do you think there would be benefits to disambiguating all words before running word2vec? Explain. (2)

Question 9

Topic: Coding

Source: Coding

Imagine we were trying to find a word that is the best prototype of its synonyms. Write a short function that grabs the lemmas of each synset in wordnet, and calculates which lemma is the best prototype (ie, which lemma is the closest to the centroid of the synset) by using the word embeddings. Ignore words that do not have embeddings in gensim. (3)
